The Washington State Coal Mine Map Collection: A Catalog, Index, and User's Guide

by

Henry W. Schasse, M. Lorraine Koler, Nancy A. Eberle, and Rebecca A. Christie

INTRODUCTION

Coal has been mined in Washington since 1853. Although current production is from surface mines, nearly all coal produced prior to about 1970 came from underground workings. Since early in this century, Washington State law has required mine operators to submit detailed plans of all underground coal operations to the state on an annual basis. About 1,100 individual maps representing about 230 mines comprise the Washington State coal mine map collection. The maps are an invaluable source of information for mine subsidence hazard evaluation and mitigation, structural geology, coal exploration, resource evaluation, and historical research.

This report is an update of the original "Directory and user's guide to the Washington State coal mine map collection", our Open File Report 83-8. This updated version includes the original catalog, two subsequent addenda (May 1984 and February 1994), index maps, cross-reference lists, and a user's guide. The revision incorporates the materials added to the collection since the original directory was published, including a user's guide to the microfilm. The text, index maps, and appendices have been updated and contain data for the full collection. The maps detailed in the catalog and two addenda have not been interfiled due to the fact that the 1983 compilation was done manually and is not in an electronic format. Table 1 has not changed.

The catalog and catalog addenda list the mines by name, operator, map title, date, and map scale and provide a brief description of features that are found on each map. The index maps outline the approximate area covered by a given mine. The appendix contains two cross-reference lists: one by mine name and one by operator name. Finally, there is a descriptive user's guide on how to use this directory to access information for any given mine property.

The collection is housed in the Division of Geology and Earth Resources office in Olympia, Washington. Each mine property has been assigned an alpha-numeric code, which is used on the index maps and in the catalog (and catalog addenda) of this directory. The original maps are stored in tubes. Each tube has a number that corresponds to its location in the storage racks—thus, this report is also a guide to the physical location of each map in the collection.

Persons interested in the mine map collection are encouraged to make full use of this guide and the information contained in the maps. For those who want access to map information without having to travel to Olympia, the entire collection is available for purchase on 35 mm microfilm. The following section about the microfilm collection includes purchasing information.

The original maps are stored in an area with a large table suitable for making tracings or detailed studies of large mine maps. However, due to the fragility and deterioration of the paper, we would like to minimize handling of the originals.

In addition to the microfilm copy, a series of 4-inch by 4-inch (105 mm) microfiche negatives are available for many (but not all) of the maps. These negatives permit enlargements up to full scale to be made, but the cost of full-scale reproduction may be prohibitive for some users. Also available for many (but not all) of the maps are transparent, Mylar positive reproductions at a scale of 1:4,800. Ozalid or photocopied prints can readily be made from the Mylars. (Note: Use of the Ozalid process is being phased out for environmental health reasons, and this option may not be available for much longer.) The three

alternative formats—35 mm microfilm, 105 mm microfiche negatives, and Mylars—are all cataloged and cross-referenced to the original mine maps.

Acknowledgments

Funding for this project came from a combination of state and federal sources and contributions by representatives of private industry. The Division of Geology and Earth Resources thanks Cominco American, Inc., GCO Minerals Co., Getty Oil Co., Hart-Crowser and Associates, Inc., Longview Fibre Co., Meridian Land and Mineral Co., Rocky Mountain Energy, Soil Sampling Service, Inc., and the Weyerhaeuser Co. for their generous contributions that aided in the completion of this catalog.

Funding for the reproducible Mylar and microfiche reductions was provided by the U.S. Bureau of Mines. Funding for the microfilming of the entire collection was provided by the U.S. Office of Surface Mining.

The authors thank William M. Phillips, Timothy J. Walsh, and Connie J. Manson of the Division of Geology and Earth Resources for their helpful suggestions throughout the project. Further acknowledgment is given to the tireless efforts of Joe-Ann Helms, who was instrumental in organizing many of the maps before this project was undertaken.

USER'S GUIDE TO CATALOG (AND ADDENDA) AND INDEX MAPS

The mine maps indexed in the catalog (and addenda) are arranged in alphabetical order by county. Under the county headings, the mines are listed by sequential index numbers which correspond to the mine locations as drawn on the index maps.

The index maps incorporate the information from our Open File Report 83-8, an addendum dated May 1984, and a second addendum completed in February 1994. The index maps show the approximate location of, and area covered by, a single mine or composite map depicting several mines in a given area.

The two addenda to the catalog follow the original catalog. Please note that the three parts are not merged, but remain as three separate entities.

Following the addenda is an appendix containing two alphabetically arranged cross-reference lists. The first is a listing of mine names, and the second is a listing of operators. Both lists are cross-referenced by number to the catalog listings and catalog addenda.

Explanation of Mine Map Catalog Tabulations

The mine map catalog tabulations are arranged under column headings. A detailed explanation of each column is given below, in order from left to right across a page.

Index Number (Index No.)

The index number is a combination of an alphabetical prefix which designates the county(ies) in which the mine or group of mines is located, and a sequential number. This alpha-numeric designation keys the catalog listing of each mine or mine area within a county to its corresponding index map. The sequential arrangement allows the user to locate the descriptive information in the catalog section (or catalog addenda) once the index number is determined from the index map. The index numbers were assigned in a generally north to south and east to west arrangement. Mining properties first listed in the addenda [K103, K104, L31, L32] do not fit into this directional scheme. The index number also links the appendices of mine names and operator names to the catalog listing.

The index number appears on all formats of the maps: full-scale maps, reduced scale reproducible Mylars, 105 mm negatives, and 35 mm microfilm.

Location

This column refers to the area represented by the cumulative extent of mine workings shown on the mine records of a given mine. It is given as standard Government Land Office coordinates of section, township, and range. Locations by legal land descriptions are abbreviated, for example, as secs. 10, 11, 15-18, 22, 26 (23-6E)—meaning sections 10, 11, 15, 16, 17, 18, 22, and 26, Township 23 North, Range 6 East. Because all of the townships in the region covered are north of the Mt. Hood baseline, the direction is not noted. Because the ranges in the region occur both west and east of the Willamette Meridian (W.M.), the direction is specified.

Mine Name; Operator

The central column lists the mine name and operator(s) of the mine (or a composite map showing several adjacent mines or a coalfield and the company which produced the map). Beneath this heading the mine maps are listed by title and in chronological order, although there are some variations to this rule. Maps with broad coverage precede maps showing more detailed features. In some places several coal seams were developed into a single mine. Where this has occurred, an effort has been made to list the maps of each seam sequentially by number and chronologically by date.

Details found on each mine map are listed in the column adjacent to the map title. Surface features are listed first, followed by mine workings and other physical details; a semicolon separates the two types of details when a map record contains both.

Date

The date used is the most recent date appearing on a given map. The map records of a particular mine can include periodically updated maps showing the progress of mine development.

Scale

The map scale is listed as a ratio. Many of the full-scale mine maps were drafted at a scale of 1 inch = 100 feet, which appears in the catalog as the ratio 1:1200.

Format of Maps in Tubes

Formats of mine maps include paper copy blueprints (blupt), bluelines (blun), blacklines (blkln), ink and pencil tracings (ink/pencil), prints on photo paper (photo), ink tracings on linen (linen), and sepia prints (sepia).

Tube Number (Tube No.)

The tube number directs the user to the tube that contains the desired map(s). The maps are stored in tube racks at the Division of Geology and Earth Resources Olympia office. The Roman numeral identifies the storage rack containing a given map tube, and the number refers to the tube location within the storage rack.

Other copies

This column identifies mines for which the Division owns reproducible copies: 4 inch by 4 inch 105 mm negatives, reduced scale 1:4,800 (1 in. = 400 ft) individual Mylar positive prints, or Mylar composite maps. The microfilm copy includes all the individual mine maps in the collection to date, with the exception of the few that were missing at the time of filming.

The 105 mm negatives were acquired by photographing many of the mine maps. Due to the size of the original maps, it was necessary to take several photographs of each map. Several negatives must be combined to produce a complete map.

The individual Mylar positive prints were produced from the 105 mm negatives. As with the 105 mm negatives, several of them must be combined to produce a complete map. In several cases the individual prints were used to construct mylar composites of major coalfields. These composites are discussed elsewhere in the text.

The term "mapbook" refers to a forerunner of the present system which contains Ozalid copies made from 1:4,800 Mylar prints. It is organized by county with pages organized by Government Land Office sections and can be a useful adjunct to the present system.

Explanation of Mylar Composites

Larger composite maps were created by splicing together and photographing some of the individual Mylar positive prints. The composite maps provide a complete view of large mines not possible with the individual Mylar sheets. They also show the correct relative geographic positions of adjacent mines. The Mylar composites are filed separately from the individual Mylar sheets and can be used to produce inexpensive blackline or blueline paper copies. They are listed under a separate heading because they are not original maps and could not be appropriately cataloged in the primary tabulation.

Mines included on each Mylar composite sheet are listed in Table 1. Individual mine names are cross-referenced by index number to the primary catalog listing of the mine. A corresponding cross-reference is also made in the primary tabulations in the catalog by the notation "Mylar composite" in the far left column.

The tube number identifies the location of the map in the physical storage system. Labels in the lower right hand corner of each Mylar composite map identify the mines appearing on the composite map. Locations of the individual mines can be determined by referring to the index maps.

User's Guide to the Mine Maps on Microfilm

The entire coal mine map collection is available on five reels of 35 mm microfilm. Purchases of single reels or complete sets will be coordinated by the Division of Geology and Earth Resources. The current (1994) price for a diazo copy is \$8.50 per reel plus shipping and handling. To buy microfilm, send a letter specifying what you want (quantity, reel number(s), diazo or silver) to: Publications, Washington Division of Geology and Earth Resources, P.O. Box 47007, Olympia, WA 98504-7007. Please include payment for the text, The Washington State Coal Mine Map Collection: A Catalog, Index, and User's Guide, with the request for microfilm. We will mail you the text and forward your request to the Microfilm Bureau. They will contact you directly about payment options. Money for the microfilm is not to be sent to the Division of Geology and Earth Resources.

The Mylar composites are not included in the microfilm collection.

The microfilm contains the catalog portion of the directory and the mine maps; it is not intended as a stand-alone product. For the index maps, appendices, and user's guide, one must still use the directory. The microfilm copy follows the same sequence as the catalog, with two exceptions/clarifications. First, the maps from the two addenda are merged with the maps from the original catalog. Second, because some users may want reels for a specific county only, the mine maps from combined county areas (Pierce-King, Lewis-Thurston and Lewis-Thurston-Cowlitz) were filmed twice: the PK maps follow both King and Pierce Counties, and the LT and LTC maps follow both Lewis and Thurston Counties.

The reels cover the maps as follows:

reel 1: K1 - K41
 reel 2: K42 - K91
 reel 3: K92 - K104
 PK1 - PK2
 Kt1 - Kt32
 reel 4: L1 - L32
 LT1 - LT3
 LTC1
 P1 - P36
 reel 5: P37 - P40
 PK1 - PK2
 S1
 T1 - T8
 LT1 - LT3
 LTC1
 W1 - W6

Before the map(s) for each mining property, a 'catalog sheet' was filmed to clearly delineate between the mine properties on the microfilm. Each frame was filmed with an identification tag showing the alpha-numeric code and letter assigned to each mine map (that is, Kt9 map C), a tag showing the frame number (when multiple frames were necessary to film one map), and a scale bar. In the few instances where a single map has two or more parts or sheets, the frames are labeled as (example only): K104 map B, sheet 2, frame 1.

The majority of the original maps are large and could not be filmed to fit on a single frame. There is potential for the user to be confused when trying to visually piece together the frames into one contiguous map. Some maps are long and narrow, whereas others required rotating and filming in two horizontal rows: upper and lower. On the maps that were filmed in two rows, the frame numbers run clockwise from the upper left corner of the map, like this:

1	2	3	or	1	2	or	1
6	5	4		4	3		2

The frames of long and narrow maps may be numbered:

1	2	3	4
---	---	---	---

The maps were filmed with ample overlap, and we hope that the frame sequences will be understandable.

Maps missing from the collection at the time of microfilming are tagged as missing on the microfilm and are listed in the errata and missing maps section, which follows.

A note on quality control and human error: The majority of the original maps are blueprints. Every effort was made to get the best possible film copy. A few maps are too faint to read; this is due to the quality of the original map. A few frames were intentionally shot twice at different light exposures to get better legibility. There are a few instances of accidental shutter-tripping, mostly on reel 1, but no map

information is lost. There may be additional errors that were not documented at the time of filming. We would appreciate hearing about them so that the errata list is accurate.

Errata and Missing Maps

Reel 1 (K1 - K41)

- K3 -- blank frame between map A and map B
- K9 -- maps D and E are reversed; E has the labels for D; the sequence as filmed is C - E - D
- K23 -- map C is a letter, and has been removed from the map collection and added to the office files
- K38 -- map A, frame 5 shot twice (2nd time is error)
- K38 -- map N, frame 6 shot twice (2nd time is error)
- K40 -- map A shot twice to assure legibility
- K41 -- map C missing
- K41 -- map D missing

Reel 2 (K42 - K91)

- K56 -- map D shot twice to assure legibility
- K60 -- map O missing
- K71 -- map A shot twice to assure legibility
- K85 -- map D shot twice (2nd time is error)

Reel 3 (K92 - K104, PK1 - PK2, Kt1 - Kt32)

- K94 -- map D shot twice to assure legibility
- PK2 -- catalog sheet shot upside down; shot 2nd time right side up
- Kt4 -- map B missing
- Kt10 -- map B shot out of correct frame sequence; first frame shot is upper right, then clockwise from there:
 - 4 1
 - 3 2
- Kt26 -- map L is a single frame (not frame 1 of several)

Reel 4 (L1 - L32, LT1 - LT3, LTC1, P1 - P36)

- P17 -- map A shot twice to assure legibility

Reel 5 (P37 - P40, PK1 - PK2, S1, T1 - T8, LT 1 - LT3, LTC1, W1 - W6)

- P37 -- map C shot upside down
- W5 -- map A shot twice to assure legibility

HISTORY OF COAL MINING DEVELOPMENT IN WASHINGTON

The earliest recorded discovery of coal in Washington was in 1833 along the banks of the Toutle River in Cowlitz County near its junction with the Cowlitz River (Roberts, 1958). According to Jenkins (1923) the first coal mine in the state was opened in Bellingham in Whatcom County in 1853 or 1854. At about the same time, coal was discovered on the Black River, near the present site of Renton, and a mine was opened there in 1854. A few years later, the coalfields of the Issaquah and Newcastle areas in King County, and the coking coal of the Carbon River and Wilkeson areas of Pierce County were discovered (Moen, 1982). The coals in the Roslyn area of Kittitas County were discovered around 1871 and productions commenced in 1886 (Saunders, 1914). By this time the industry was well-established throughout the coal-producing regions of the state. Annual coal production grew from 5,000 tons in 1860 to 100,000 tons by 1876; by 1888 it exceeded 1 million tons per year. By 1890 coal ranked second in importance to lumber as an export product of Washington.

In the three decades that followed, coal production increased significantly owing to its use as a domestic heating fuel as well as fuel for the railroads. Peak production of 4.1 million tons was reached in 1918. Inroads made by competitive fuels, especially heating oils, started in the 1920's. Thereafter, coal use and production fell steadily, as competition from fuel oil, natural gas, and hydropower took effect. In the 1960's annual production dropped below 100,000 tons and hit an all-time modern low of 37,000 tons in 1970.

In 1971 the declining trend in state coal production was reversed by the opening of large-scale surface mining operations in Centralia. About 4 to 5 million tons of sub-bituminous coal for power plant use are produced annually at the Centralia mine. Smaller-scale surface mining is conducted in the Black Diamond area of King County. The 1970's also saw the closing of the last underground mine in Washington—Palmer Coking Coal Company's Rogers No. 3 mine in the Landsburg area of King County.

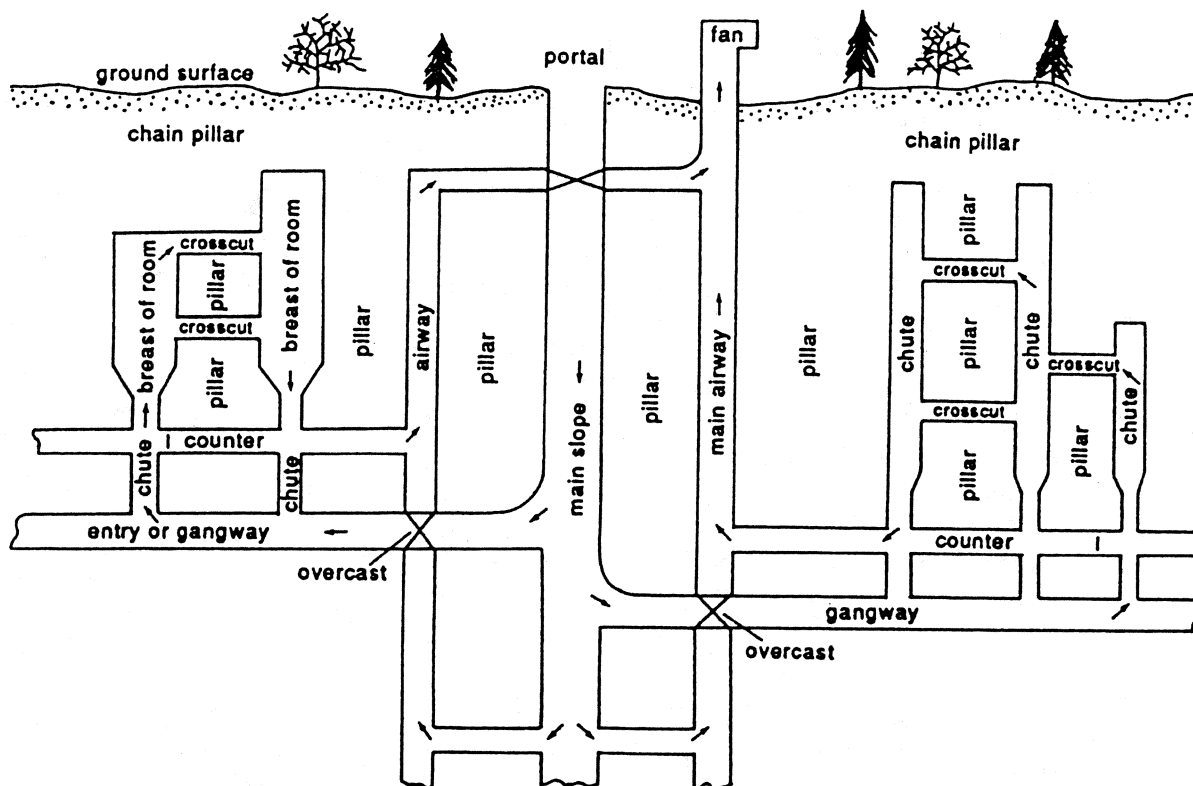

MINING METHODS

The following brief description of underground coal mining methods, as practiced in Washington, is included as a very general outline of the more common features of coal mining for those unfamiliar with the subject. The main underground features of a coal mine are illustrated in the diagram which accompanies this section. One should bear in mind that the workings illustrated are in the plane of the dipping coal bed. The following descriptions are taken from Green (1947) and Beikman and others (1961).

Most of the early underground mines were water level or drift mines. They were usually begun on coal seams which were exposed at the surface in the valleys of streams. Tunnels or drifts were driven in the coal from about stream level, and the coal occurring above this elevation was mined through these tunnels called "water-level gangways". The workings were driven slightly up the dip of the coal bed so that the mine would be self-draining. As coal above the level of the portal was mined out, the mine was abandoned or slopes (inclined tunnels) were driven down the dip of the coal bed and pumps were installed to remove excess water.

Entries (near-horizontal tunnels) which are turned off the main slope on the strike of the seam are driven in pairs. One is called the "gangway" and is used for haulage purposes. The other is called the "counter" and is driven 40 to 60 feet above the gangway (as measured along the slope of the bed). It functions as a travel way for the return of air. Where an air course crosses a haulageway, it is carried overhead in an airtight and fire-proof tunnel called an "overcast" which is usually shot out of the roof and floored with reinforced concrete.

In coal mining practice in this state, chutes were driven up dip from the haulageways or gangways for the purpose of extracting coal between the different levels which were usually spaced 200 to 400 feet apart. The term "chute" was used for passageways not over 12 feet wide. When these passageways

Main underground features of a coal mine (after Green, 1947). Arrows indicate direction of air travel.

exceeded 12 feet in width they were called "rooms" or "breasts". The terms "room" and "breast" are synonymous, breast being used for steeper dipping seams, and room for the seams with low dip angles. Coal was moved by gravity down chutes to the gangway as it was mined. Adjacent chutes were connected at 50 or 60 foot intervals by horizontal tunnels called "crosscuts" which were necessary for ventilation. The chutes were driven up the inclination of the coal bed until they reached the barrier pillar or "chain pillar". Chain pillars were left for protective purposes between the top of the chutes and the level above. In the case of the first level chain pillars were left between the top of the chutes and the ground surface. When gangways, chutes, and crosscuts (collectively called development work) were completed, the block of coal or "pillars" outlined by the chutes and crosscuts were mined out. Modifications of the chute and pillar, breast and pillar, and room and pillar methods were occasionally used. Evans (1912) described the various methods of underground mining employed in western Washington, particularly in King County. For a more complete description of these methods the reader is referred to his section on coal mining methods.

In areas of steep dip, coal development is conducted from rock tunnels crossing a number of beds. Rock slopes (inclined tunnels in rock) are sometimes driven to intersect another seam to allow development to continue, especially when a fault is encountered. Shaft mining was rarely used in Washington, since there are few occasions where flat dips predominate.

EXPLANATION OF INDEX MAPS

The coal mines represented in the mine map collection are identified in the catalog directory by an index number that corresponds to a location map showing the approximate extent of workings of that mine. It is important to note that the areas shown on the index maps do not necessarily show the total extent of underground mine workings, but are intended to show their approximate extent on the basis of map records in our collection. The outline of each mine area, corresponding to a specific index number, represents the best judgment on the part of the compilers of the directory as to the extent of that mine's underground workings.

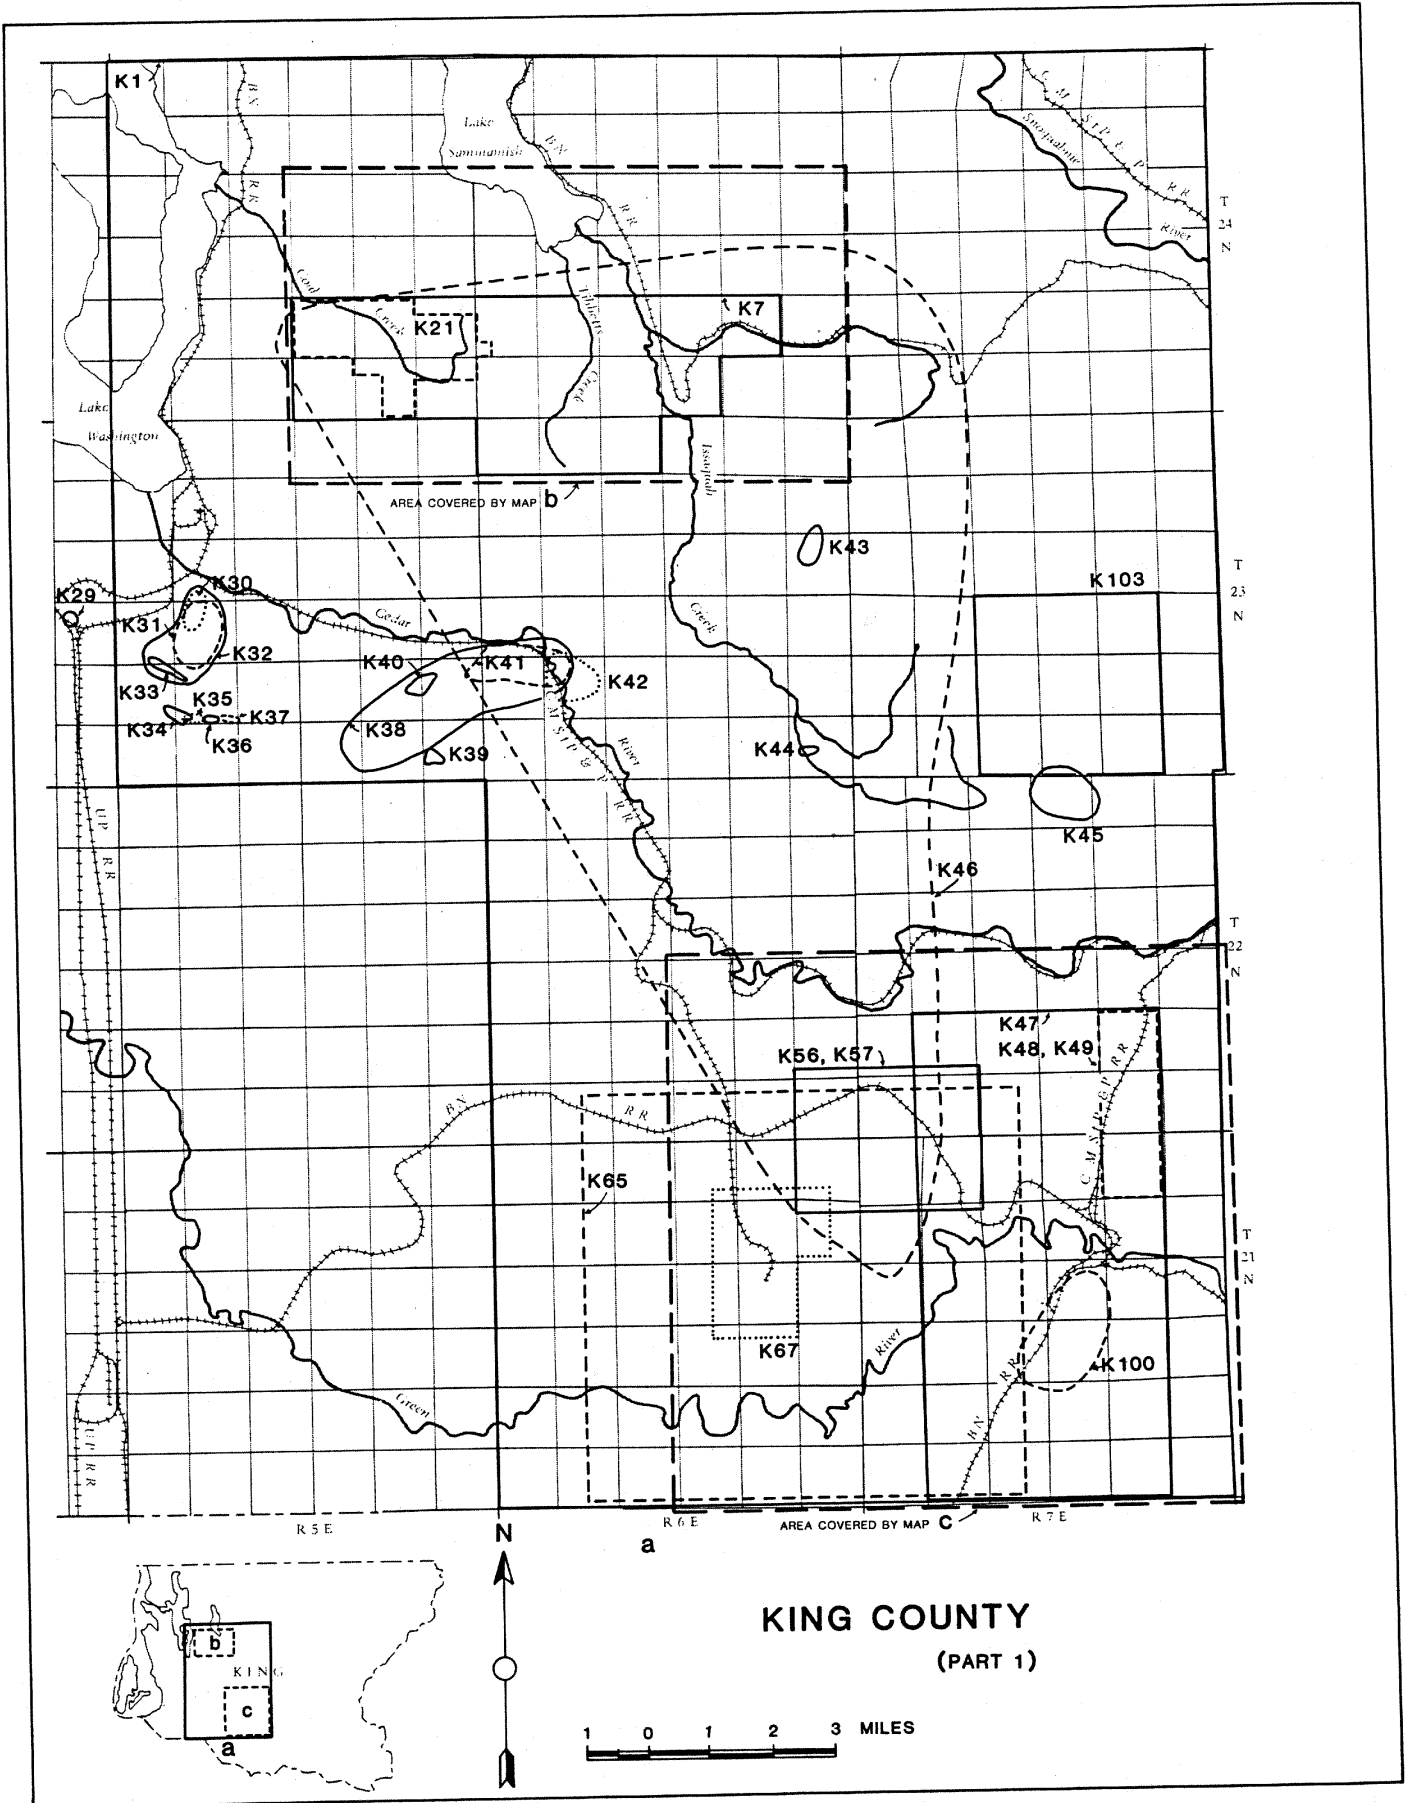

In some instances, some of the index map areas corresponding to a particular mine will extend into land sections that are not identified in the Location column of the catalog. In such cases, the mine workings will have appeared on map records of the adjacent mines. An attempt has been made to cross-reference the adjacent mine in the catalog description of the mine in question.

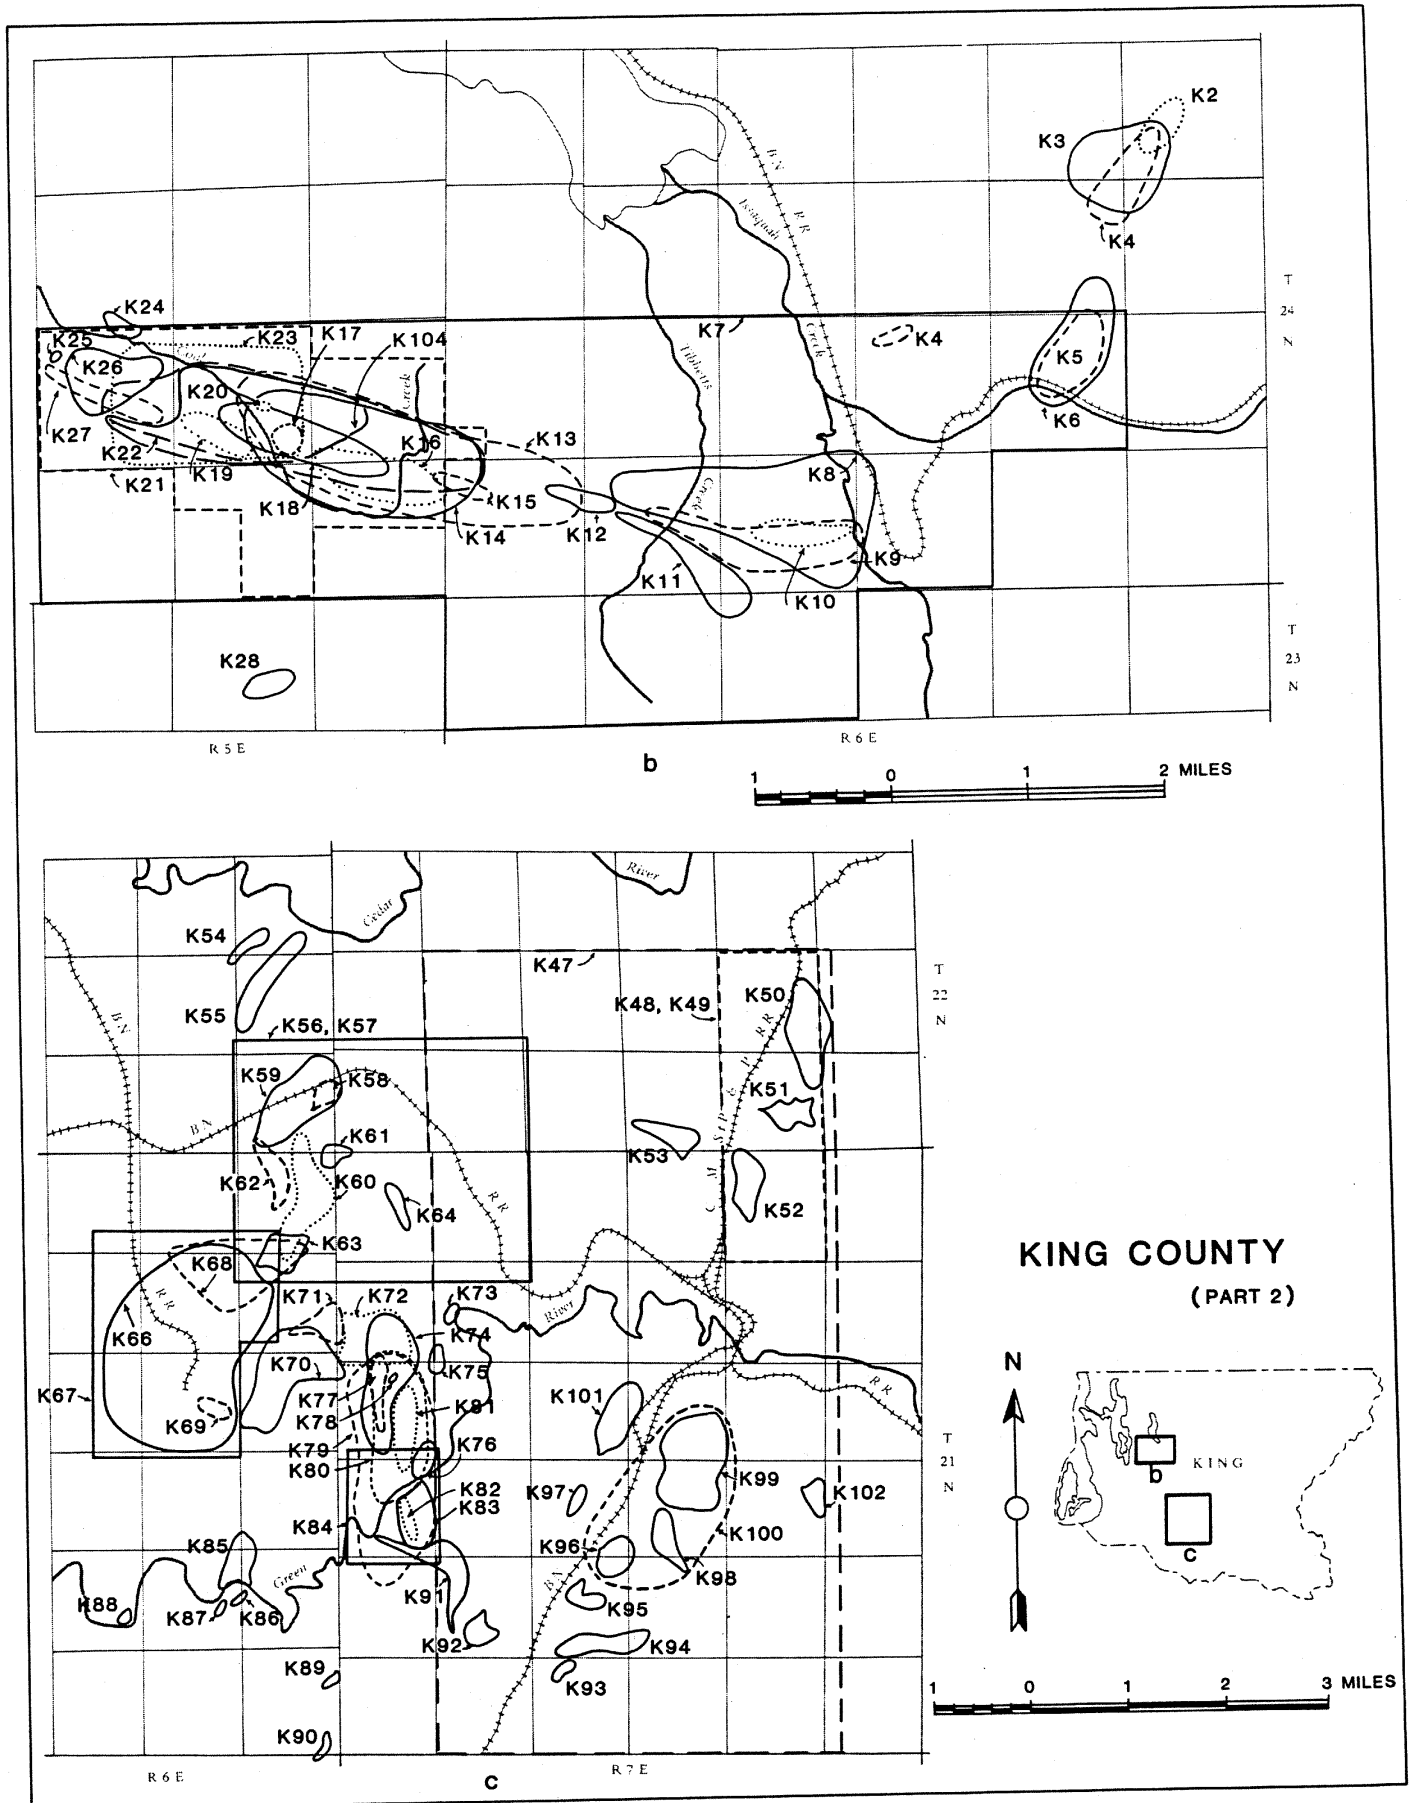

There are a few instances where workings were developed beyond those shown for a given mine area, but which only appear on a composite map showing the workings of several mines. These composite maps are likely to postdate the latest mine map record for the given individual mine. In such cases the composite mine map will be cross-referenced to the individual mine listing in the catalog by a notation in the Details column.

INDEX NO.	LOCATION	MINE NAME: Operator		DATE	SCALE	FORMAT OF MAPS IN TUBES	TUBE NO.	OTHER COPIES
		Title	Details: Surface features Mine workings, etc.					
K86	Secs. 25, 26 (21-6E)	<u>KUMMER MINE</u> : Palmer Coking Coal Co.					VII-25	mylar
		A. Kummer mine, main slope no. 4 vein, south of river	Roads, streams, elevations; mine workings and proposed water level tunnel. Development on old Denny-Renton no. 4 vein south prospect	1956	1:1200	1 bluln		
K87	Sec. 26 (21-6E)	<u>JOHNSON COAL CO. MINE (KUMMER)</u> : Johnson Coal Co.					VII-25	mylar
		A. Brunton and tape survey of Johnson Coal Co. mine	Streams, elevations; mine workings. Shows old Denny-Renton, no. 1 vein prospect south of river	1946	1:1200	1 blupt		
K88	Sec. 27 (21-6E)	<u>GEM COAL CO.'S MINE</u> : Gem Coal Co.					I-26	mylar mapbook
		A. Gem Coal Co., King County near Kummer	Roads, buildings, elevations; mine workings	1940	1:1200	1 blupt		
K89	Sec. 36 (21-6E)	<u>BLUE BLAZE COAL CO. MINE</u> : Blue Blaze Coal Co.					I-28	mylar
		A. Blue Blaze Coal Co.	Buildings, elevations; mine workings	1940	1:1200	1 blupt		
K90	Sec. 1 (20-6E) sec. 36 (21-6E)	<u>GREEN RIVER MINE — GREEN RIVER COAL CO'S MINE</u> : Green River Coal Co.					I-27	mylar, mapbook
		A. Map showing location of workings in Green River Coal Mining Co. mine	Elevations; mine workings	1932	1:1200	1 blupt		
		B. Map showing location of workings in Green River Coal Mining Co. mine	Buildings, elevations; mine workings	1935	1:1200	1 blupt		
		C. (Sketch map) Green River mine	RR tracks, buildings; mine gangways	1935	1:1200	1 blkln		
K91	Secs. 19, 20, 29, 30 (21-7E)	<u>HYDE MINE</u> : Hyde Coal Co.					VII-28	mapbook, mylar composite
		A. Map showing portion of Hyde mine	Elevations, contours; mine workings and drainage tunnel	1917	1:1200	1 bluln 1 sepia		
		B. Hyde mine	RR tracks, streams. Traced from P.C.C. Co. map	1921	1:6000	1 blkln tracing		
		C. Map of the property of Hyde Coal Co.	Roads, RR tracks, buildings, streams, elevations, contours; mine workings, cross sections. Vicinity map: 1:15,840. Shows Hyde, Cannon, Navy, Sunset, Independent and south end end of Franklin mines	1921	1:1200	1 blupt		
		D. Details of two schemes to tap the Hyde coal mine: Plan I—tapping by drilling (approved); Plan II—by dynamiting (not approved)	Mine workings—side view profiles, cross sections. Map by George Watkin Evans, mining engineer	no date	1:120	1 blupt		
		E. Hyde drainage tunnel, copy of sketch 4/15/40 by J. Williams	Mine tunnel	1942	1:1200	1 ink sketch		
		F. Plan and section of dam in Hyde tunnel	Cross sections	1941	1:1200	1 blupt		
		G. Hyde tunnel and old Cannon mine workings	Mine workings and tunnels	1941	1:1200	1 blupt		
		H. Hyde Tunnel, traced from P.C.C. Co.'s map of Franklin mines	Elevations; mine workings	1944	1:1200	1 blkln		
								microfilm reel 2

**ADDENDUM
MAY 1984**

This addendum consist of an index to 39 maps given to the Division of Geology by the University of Washington in the fall of 1983 and 23 maps from the collection of Palmer Coking Coal Company in March 1984. The new maps have been cataloged and filed in sequence with the existing collection. When a new map's date places it within the existing sequence, it has been given a catalog number as a subscript of the map it follows, for example, P37 D₁. Two new mine area represented in King County have been assigned the next available numbers: K103 and K104.

INDEX NO.	LOCATION	MINE NAME: Operator		DATE	SCALE	FORMAT OF MAPS IN TUBES	TUBE NO.	OTHER COPIES

**ADDENDUM
FEBRUARY 1994**

This addendum consists of a catalog to the maps donated to the Division and added to the coal mine map collection in February 1994; these have been cataloged and filed in sequence with the existing collection.

When an added map's date places it within an existing chronological sequence, it has been assigned a subscripted letter designation; for example, K96 A₁ falls between K96 A and K96 B.

When an added map falls at the end of an existing sequence, it has been assigned the next sequential letter designation; for example, T5 E falls after T5 D.

Maps of two mine properties in Lewis County have been added to the collection: L31 and L32.

NOTE: The outlines of mining properties drawn on the index maps incorporate properties listed in Open File Report 83-8, the Addendum dated May 1984, and this second addendum, completed in February 1994.
